

Off-site Backup

You can't plan for the disasters that take out your organization's IT operations. Accidents, fires, floods, thefts happen when they will and usually when they are most inconvenient.

You *can* back up data to make sure that your systems are quickly and completely restored and your organization gets right back to business.

How are you protecting your business critical systems?

Most organizations have some method of copying files for safekeeping. Typically, end-users backup their data to external hard drives that reside next to their workstation. Servers are similarly backed up to external media that sits next to them on the shelf.

Should the end-user computer or server fail, IT technicians can restore data and files. But are those backups current? Have applications and operating systems been properly replicated? And how will those on-site backup systems help if they too are burned, flooded, or otherwise damaged?

Off-site Backup from Systems Plus

True protection of your organization's end-user computers, servers and the operating systems, applications and business data that resides on them, is achieved through a combination of onsite and offsite backup.

Off-site Backup from Systems Plus supports onsite backup systems that are already in place. Even when onsite systems fail or get damaged, your organization will be able to restore IT operations in very short order.

Systems Plus technicians rely on their deep experience in backup design implementation and management and market leading technology from Carbonite™ to replicate end-user workstation and server data to the Cloud.
